Results 1 - 2 of 2 short listing

1 Merging multiple data streams on common keys over high performance networks 99%

Marco Mazzucco , Asvin Ananthanarayan , Robert L. Grossman , Jorge Levera , Gokulnath Bhagavantha Rao

Proceedings of the 2002 ACM/IEEE conference on Supercomputing November 2002

The model for data mining on streaming data assumes that there is a buffer of fixed length and a data stream of infinite length and the challenge is to extract patterns, changes, anomalies, and statistically significant structures by examining the data one time and storing records and derived attributes of length less than N . As data grids, data webs, and semantic webs become more common, mining distributed streaming data will become more and more important. The first step when presented ...

2 Search 2: Searching with numbers 82%

Rakesh Agrawal , Ramakrishnan Srikant

Proceedings of the eleventh international conference on World Wide Web May 2002

A large fraction of the useful web comprises of specification documents that largely consist of attribute name, numeric value pairs embedded in text. Examples include product information, classified advertisements, resumes, etc. The approach taken in the past to search these documents by first establishing correspondences between values and their names has achieved limited success because of the difficulty of extracting this information from free text. We propose a new approach that does not ...
